Executive Summary

This analysis covers five years of order, customer, product, payment, shipment, return, review, and marketing data for the ecommerce business **(2021–2025)**, cross-checked against the accompanying Power BI report.

The core problem: revenue is flat.
Delivered revenue moved in a narrow band every year EGP 4.02M (2021), 3.98M (2022), 4.11M (2023), 3.89M (2024), and 4.21M (2025) with **no compounding growth across five years**. Customer signups tell the same story, holding around 810–860 a year the whole way through. Since acquisition isn't moving, growth has to come from getting more out of existing customers.

Repeat business is the biggest gap.
Of everyone who's bought at least once, **42%** never came back. That's the single largest lever in the entire dataset bigger than any channel or category shift because it's the one metric directly suppressing revenue while acquisition stays flat.

Loyalty tiers aren't producing loyalty.
VIP customers spend about EGP **5,368** over their lifetime barely different from New (EGP 5,054) or Loyal (EGP 5,074) customers. The segment label exists, but it isn't backed by different buying behavior.

Delivery is unreliable everywhere, not in one weak spot.
Only **57.7%** of shipments arrive by the promised date, and that number barely shifts between carriers **(56–59%)** or warehouses. It's a systemic promise setting issue, not one bad partner and it directly feeds the returns problem, since late delivery is the fourth-leading cause of returns.

Returns run at 7.4% of orders (EGP 1.54M in refunds).
split almost evenly across damage, sizing, wrong item, not-as-described, and late delivery. No single fix solves it packaging and picking accuracy, product content, and delivery timing each need separate attention.

Channel and marketing spend aren't matched to performance.
The website and mobile app carry **70%** of revenue with near-identical order values essentially the same customer using two doors. Social commerce is the

Sales Growth By Gov

Strategies

- **Fix delivery reliability first re-baseline** delivery-date estimates against what carriers actually achieve, not an aspirational number. This is the highest-leverage single fix because it touches retention, returns, and reviews simultaneously.
- **Make the second purchase the primary growth target Build** a dedicated incentive and follow-up sequence around a customer's second order, timed to their first-purchase category. With acquisition flat, this is where growth has to come from.
- **Rebuild loyalty tiers around real thresholds tie** VIP and Loyal status to a measurable spend or frequency bar, and attach a benefit only unlocked there early access, guaranteed delivery window, or a spend-based reward. Right now, the label doesn't change behavior.
- **Reallocate marketing budget toward what's already working shift 10–15%** of affiliate and email spend toward Meta and TikTok over one quarter, and confirm the efficiency holds at higher volume before shifting further.
- **Split the returns fix by cause Damage** and wrong-item returns need warehouse and packaging fixes. Sizing returns need better product content and imagery. Late-delivery returns get solved by priority one. Treat them as three separate initiatives, not one.
- **Invest deliberately in Social commerce fund** a shoppable catalogue and in-app checkout build over the next two quarters, paid for by the Marketplace/Affiliate reallocation above. It's the clearest channel-level growth bet in the data.
- **Investigate the Cairo underperformance Cairo** ranks lowest of the top ten governorates by revenue despite being the largest market. It is worth checking whether it's a demand issue, competition, or a fulfillment capacity constraint before writing it off.
- **Track performance by category, warehouse, and payment method going forward The** current data supports diagnosis by cause but not yet by origin that's the next layer needed to assign accountability and measure whether these fixes are working.

Priority Roadmap — Next Two Quarters

Now (0–30 days)

- Re-baseline delivery-date estimates against real carrier performance this is the lowest-cost, highest-leverage fix, since it touches retention, returns, and reviews at once.
- Shift **10–15%** of the affiliate and email acquisition budget toward Meta and TikTok
- Launch a second-purchase incentive targeted at the **42%** one-time-buyer segment

Next (30–90 days)

- Redefine VIP/Loyal tier qualification around real spend or frequency thresholds, and attach a benefit only unlocked at that threshold
- Split the returns initiative by cause packaging/QC fixes for damaged and wrong items, sizing content for size issues
- Run a Cairo-specific demand and fulfillment investigation to explain its underperformance relative to other governorates.

Next Two Quarters (90–180 days)

- Build out social commerce with a shoppable catalogue and in-app checkout, funded by the **Marketplace/Affiliate** reallocation
- Launch a **grocery** replenishment/subscribe-and-save flow to convert the category's naturally short reorder cycle into measurable repeat revenue
- Re-test delivery-speed messaging in marketing only once on-time performance clears **75–80%**.
